Requester's Full Name: Jon Stone Examiner#: 79699 Date: 8/1/03
 Art Unit: 2178 Phone Number: 305-7854 Serial Number: 9/370706
 Mail Box and Bldg/Room Location: 4B16 PK2 Results Format Preferred (circle): Paper Disk E-mail

If more than one search is submitted, please prioritize searches in order of need. #1

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc., if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Large Data Set Storage / Display for electronic spreadsheet applied to machine vision
 Inventors (please provide full names): McGarry, John

Earliest Priority Filing Date: 8/9/99

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

Broad claim = 1

A spreadsheet in which a single method object is ~~single~~ instantiated in a cell. That object stores data and has a single member function that returns a single value. A single display button is provided for displaying the data under a partially transparent grid spreadsheet gnd.

~ object-oriented spreadsheet
 ~ image processing

Abstract (Basic): US 6195945 B1

NOVELTY - The device includes a base wall with a pair of spaced apart side walls outwardly extending from the inner surface of the base wall. Each side wall is generally triangular and has a vertex corner, and a pair side edges extending from the vertex corner towards the ends of the base wall.

USE - Prefabricated arch structure for aiding the construction of an archway.

DESCRIPTION OF DRAWING(S) - Schematic perspective view of the arch structure.

Model image comparison for circuit pattern evaluation, involves computing gray value difference between overlapping selected and sample pixels, to determine compressed and expanded binary pattern

Patent Assignee: COGNEX CORP (COGN-N)
Inventor: MCGARRY E J
Number of Countries: 001 Number of Patents: 001
Patent Family:

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 6154567	A		15	G06K-009/00	

Abstract (Basic): US 6154567 A

NOVELTY - The gray value differences between overlapping sample pixels of model image are computed and accordingly compressed and expanded binary patterns are determined. Gray value difference between overlapping selected pixels of time image is computed, to determine compressed and expanded patterns. The expanded pattern of sample and selected pixels are compared, to estimate increment count value.

DETAILED DESCRIPTION - The sample pixels are extracted, by deriving

the pixel sequences from the model image and determining the zero-cross point of gray scale. The compressed and expanded binary patterns are determined, by computing 3-bit patterns of model and time images. The model elements are produced, by associating the pixel position with expanded binary pattern. The match count value is determined, if both corresponding bits is equal to one. All count values are combined to obtain the total count value. An INDEPENDENT CLAIM is also included for time relative image searching method.

USE - For pattern recognition in alignment, inspection and verification of ICs during fabrication and testing.

ADVANTAGE - Enables measuring image similarity quantitative, by extracting the patterns relevant to illumination intensity and independent of gray scale factor. The position of model scene with respect to image is determined correctly, thereby image registration is improved. Eases generation of models, by efficient inexpensive high speed hardware components.

DESCRIPTION OF DRAWING(S) - The figure shows the flow chart representing model generation process.

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
US 6126591	A	16	A61B-001/04	

Abstract (Basic): US 6126591 A

NOVELTY - Video endoscope has an insertion tube and a scope body (102). A mount (220) includes a sleeve (210) which defines a central opening into which the scope body and mounting post may extend and has a slot, extending the length of the sleeve, through which the insertion tube may pass. The scope body has a first part of a lock and a first part of an alignment mechanism. The mounting post also has a first part of the lock and the alignment mechanism. Complementary parts of the lock and alignment mechanism are located on the sleeve.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following: a) a remote visual inspection system, b) a mount for mounting a video monitor onto a video endoscope and a mounting post.

USE - This invention relates to remote visual inspection systems, in particular to a flexible video monitor assembly for use with remote visual inspection systems.

ADVANTAGE - This invention includes a handheld video monitor, which has a center of gravity within or over the palm of the user. It is relatively light-weight and is easy to upgrade to better video monitors. It is flexible in that the video monitor may be deployed in a number of ways.

DESCRIPTION OF DRAWING(S) - The drawing shows a side view of the video image-scope insertable into a video monitor mount.

Abstract (Basic): US 6066089 A

NOVELTY - The remote visual inspection system includes an endoscope and a case (100). The case has a main section (106) and hinged section. The main section accommodates a light source and the hinged section accommodates the endoscope. The hinged section includes a drum which is rotatable with subject to the case and holds the flexible insertion tube.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(a) portable drum for holding insertion tube;
(b) device for transportation and storage of remote visual inspection system

USE - For remote visual inspection system e.g. flexible fiber scopes and flexible video image scope used in medical and industrial field.

ADVANTAGE - The case facilitates storing and transportation of portable remote and visual inspection system. Also facilitates deploying of visual inspection system at field site.

DESCRIPTION OF DRAWING(S) - The figure shows the partially disassembled view of the case.

JP 2000505203	W		30	G01B-011/24	Based on patent WO 9825409

Abstract (Basic): WO 9825409 A

The apparatus forms an image of the periphery of an object using a camera located at a sub focal length working distance from the object. A first substrate has a first reflecting surface (52) of a first surface area, both of which include a region that is partially light transmissive.

A second substrate has a second reflecting surface (58) confronting the first reflecting surface, which has a second surface area less than the first surface area. The second substrate is parallel with the first substrate. A light source is provided for back lighting or illuminating the periphery of the object.

USE - For machine vision and especially for image formation systems for viewing periphery of object such as semiconductor wafer.

ADVANTAGE - Provides for reduced camera vibration.

Abstract (Basic): WO 9739416 A

Device comprises a standard video camera (18) and lens (20) with PCB (22) and LEDs (24). Diffuser layer (26) is for brightfield illumination and opaque mask layer (28) has cutouts for the diffuser layer and LEDs. A slot aperture is located between rows of LEDs and is a cut-out of the PCB, providing the only paths from the surface of the reflective substrate to the lens and the camera image sensor. LEDs (24) are arranged in rows, each row being a different distance from the centre line of element (26) to provide either high or low angle darkfield illumination. Opaque baffle (30) surrounds most of the lens and LEDs. The indices (14) can be formed by e.g. laser ablation with a pattern of soft pits which appear darker than their surroundings under brightfield illumination, viewing being improved by use of the elongated slot aperture.

USE - Image formation device relates to machine vision particularly automated optical detection of indices such as alphanumeric characters and fiducial marks on a mirror-like substrate or semiconductor wafer.

Abstract (Basic): GB 2187737 A

Prepn. of 2,6-dihalo-4-cyanophenol esters of formula (I) (where R = alkyl; X = BR or (I)) comprises reacting a cpd. of formula (II) in a 2 phase system, with an acylating agent of formula RCOCl (III) or RCO-O-COR (IV) in a phase system comprising an aq. phase and an organic phase comprising a water-immiscible solvent and in the presence of nitrogen contg. bases and phase transfer catalysts.

Pref. (II) is prepd. by halogenating 4-hydroxybenzonitrile in an aq. phase using a halogenating agent generated in situ by reaction of molecular chlorine with a halide ion-contg. material.

USE/ADVANTAGE - (I) are useful as herbicides. They can be prepd. without the need to isolate the intermediate 4-hydroxy-3,5-dihalobenzonitrile.

Abstract (Basic): EP 136033 A

Compsn. for topical application to animals to control endoparasites comprises an endoparasiticide and a carrier comprising at least one ketone selected from cpds. of the formula R1-CO-R2 (I) R1 and R2 each independently = 1-6C alkyl or 5-6C cycloalkyl.

Active ingredient is pref. tetramisole or, esp., levamisole, but may also be e.q. avermectins, triclabendazole or rafoxanide. The pref. concn. of levamisole or tetramisole is 1-30% w/v; that of ivermectin is 0.01-2%, that of triclabendazole is 0.5-15%, and that of rafoxanide is 0.5-15%.

Pref. at least one of R1 and R2 is branched chain alkyl or cycloalkyl, and in esp. pref. cpds. R1 is isobutyl or isoamyl and R2 is propyl, n-butyl, isobutyl or isoamyl. Most pref. the cpd. is methyl isobutyl ketone or di(isobutyl) ketone. There may also be present one or more additional organic solvents, esp. di(1-6C alkyl) esters of 2-6C dicarboxylic acids, and di (2-6C carboxyl) esters of ethylene glycol, diethylene glycol, triethyleneglycol, propyleneglycol or butane-1,4-diol. Pref. cpds. include ethylene glycol diacetate, diethylene glycol diacetate and butane 1,4-diol acetate.

USE/ADVANTAGE - Comosn. has improved efficacy and freedom from unacceptable skin reactions even when applied to sensitive breeds of animals. It has long shelf-life even when it includes levamisole or tetramisole.

Abstract (Basic): EP 41343 A

Prepn. of a gamma-unsatd. carboxylate of formula

R1R2C=CR3-CR4R5-CH2-COOMe (I)

comprises (a) slowly adding an allyl alcohol of formula

R4R5C=CR3-CR1R2-OH (II)

to a stoichiometric excess of trimethyl orthoacetate (III), heated to a temp. at or near its b.pt. in presence of an acidic catalyst; (b) distilling off excess (III) until the mixt. reaches 130-160 (pref. 135-145) deg.C; and (c) maintaining the mixt. at 130-160 deg.C.

R1 - R5 are each H or 1-6C alkyl. Pref. R1-R3 are H and R4 and R5 are both Me. (I) are intermediates in the prepn. of the acid gp. of insecticidal cyclopropane carboxylates i.e. pyrethroids. (I) are obtd. in good yield.

Abstract (Basic): EP 40958 A

Prod. of unsatd. esters of formula R1R2C:CR3.CR4R5.CH2.COOEt (I) comprises slowly adding the allyl alcohol R4R5.C:CR3.CR1R2.OH (II) to triethyl orthoacetate (EtO)3.C.CH3 (III) heated to 130-160, pref. 140-150, deg.C. Reaction is in presence of an acid catalyst. In the formulae, R1,R2,R3,R4 and R5 are each H or 1-6C alkyl. Pref. ethanol is continuously distilled out and addn. of (II) is continued until ethanol removal is complete. Esp. 1-1.5, pref. 1-1.2, moles (III) are used per mole (II), and pref. catalysts are inorganic and Lewis acids, phenol, naphthol, or aliphatic or aromatic carboxylic or sulphonic acids.

(I) are intermediates for pyrethroid insecticides. The method is esp. used to make ethyl 3,3-dimethylpent-4-enoate from prenol. High yields of (I) are achieved without the need for a large excess of (III) (the conventional method of J.Am.Chem.Soc., 92 (1970) 741 requires 7 equivalents). The reaction is relatively rapid, e.g. 15 hr. at the 40 mole scale for a 91% yield.

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
US 4282390	A	10		

Abstract (Basic): US 4282390 A

Polyphenols of formula (I) are new. In (I) ((a) R2 is Br; X is Cl; R is H or methyl and R1 is F; (b) R2 is Br; X is F; R is H and R1 is Cl or F; (c) R2 is I; X is F; R is H and R1 is F or Cl).

Cpds. (I) are prepd. e.g. by reacting 2 moles p-substd. phenol (II) with 1 mole p-substd. 2,6-bis(1-hydroxyalkyl) phenol, or by reacting 2 moles p-substd. 2-(1-hydroxyalkyl) phenol with 1 mole (II).

This is a Division of US4163801 (63083B) which describes use of (I).

Cpds. (I) are useful for killing trematode and nematode parasites e.g. the liver fluke *Fasciola hepatica* in cattle, sheep and goats, or *Haemonchus contortus* in nimirants. The usual dose for control of flukes is 1-50, esp. 1-20, mg per kg.

Abstract (Basic): US 4163801 A

Eradication of trematode infestations in warm blooded animals is effected by admin. of a cpd. of formula (I) or its salt or optical isomer.

In (I), R1-3 are each H, (1-6C) alkyl or (2-6C) alkenyl; B, C and D are each halo, (1-6C) alkyl, (2-6C) alkenyl, (2-6C) alkoxy, OH, CN, NO2 or COR5; R5 is OH or (1-6C) alkoxy; A, E, X, Y and Z are each H, (1-6C)alkyl, (2-6C) alkenyl, (2-6C) alkoxy, OH, CN, NO2, or COR5; J and dG are each H, (1-6C) alkyl, CCl3 or together with germinal H forms = CCl2

Used esp. for controlling *Fasciola* sp. such as *F. hepatica* and *F. gigantica* (I) is administered at the rate of 1 to 50 mg./kg.

Priority Applications (No Type Date): AU 772341 A 19771108

Abstract (Basic): DE 2848493 A

Compsn. for killing internal parasites in warm-blooded animals
contains as active ingredient a cpd. of formula (I) (or its optical
isomer or salt) and an inert carrier.

In (I) R1 and R2 = H, alkyl, alkoxy, alkylthio, alkylsulphinyl,
alkylsulphonyl, aryloxy, arylthio, arylsulphinyl, arylsulphonyl (all
opt. substd.) halo, OH, CN, SCN, NO2 or NR3R4. R1+R2 may together be
oxo, =NR5 or =CR6R7. R3 and R4 = H, alkyl, or aryl, or NR3R4 is a
heterocycle. R5 = OH, alkyl, aryl or anylamino. R6 and R7 = H, alkyl,
halo, CN, NH2, NO2 or CONH2. X and Y = halo, NO2, CN, alkyl, aryl,
aryloxy, alkoxy (all opt. substd). SH, alkylthio, alkylsulphinyl,
alkylsulphonyl (all opt. substd.) SO3H, alkoxysulphonyl, SCN, NH2,
acylamino, mono- or dialkylamino. W and Z = H, R10 or R11. R8, R9 R10
and R11 = H, alkyl, acyl, alkenyl, carboxymethyl, alkoxycarbonylmethyl,
aryloxyacetyl, alkoxycetyl, alkoxycarbonyl or aroyl. All aliphatic
gps. have is not >6C.

Cpds. (I) are new provided that when R1 and R2 = H and/or 1-6C
alkyl, or one is H and the other 1-6C chloroalkyl, then one of X and Y
is other than Cl, Br or I.

Used esp. for controlling fast and haemonchus species. A unit dose
(for control of liver flu pref. contains 1-20 mg/kg.

English Abstract

A machine vision sensor is provided that includes a processor (42); a camera for capturing images (43); and a display for displaying captured images to be analyzed (41), and for displaying a spreadsheet for analyzing the image (46). The spreadsheet is displayed in semi-transparent relationship with the image. A hand-held control pad (44) can be used as the sole input and control device for accessing a plurality of menus having various vision tools. The spreadsheet provides an easy-to-use environment and user interface for programming machine vision applications. The hand-held control pad can be used to navigate over the spreadsheet, thereby selecting cells of the spreadsheet (46). When a particular cell of the spreadsheet is selected, a change occurs in the appearance of the image displayed (47). The spreadsheet can be used to create a user interface for controlling analysis of the captured image.

French Abstract

La presente invention concerne un capteur de vision artificielle qui comprend un processeur, une camera permettant la capture d'images, et un afficheur destine a afficher les images capturees a analyser et destine a afficher un tableur de facon a analyser l'image. Ce tableur est affiche en semi-transparence avec l'image. Un boitier de commande manuel peut etre utilise, seul dispositif d'entree et de commande permettant d'accéder a une pluralite de menus possedant divers outils de vision. Le tableur offre un environnement facile a utiliser et une interface utilisateur permettant de programmer des applications de vision artificielle. Le boitier de commande manuel peut etre utilise pour naviguer dans le tableur, selectionnant de cette maniere les cellules du tableur. On peut aussi utiliser le boitier de commande pour selectionner les rubriques des menus, et pour selectionner des caracteres alphanumeriques comme parametres a entrer dans le tableur. Quand on a selectionne une cellule particuliere du tableur par l'intermediaire du boitier de commande, une modification survient dans l'apparence de l'image affichee, ou dans l'apparence d'une couche de graphique affichee en surimpression de l'image. On peut, de plus, utiliser ce tableur pour creer une interface utilisateur destinee a commander l'analyse de l'image

capturee ou d'autres processus industriels. Cette interface utilisateur est particulièrement interessante pour des applications de vision artificielle ou d'autres applications faisant appel a d'importants ensembles de donnees.

English Abstract

A user interface is provided for programming machine vision applications that includes an image window for displaying an image to be analyzed (41), and a spreadsheet (46) for analyzing the image displayed with the image window. A hand-held control pad (44) is used to navigate over the spreadsheet (46), thereby selecting cells of the spreadsheet. The control pad is additionally used for menu item selection, and for spreadsheet input. The spreadsheet is semi-transparent, and is adapted to perform conditional cell execution, as well as operate on time interval data. When the control pad indicates a specific cell of the spreadsheet, a change occurs in the image to be displayed (47). Buffered outputs are utilized for circular references or recursive operations. Complex vision objects are also instantiated as a single cell in the spreadsheet.

French Abstract

Cette invention concerne une interface utilisateur pour programmation d'applications de vision machine qui comprend une fenetre pour l'affichage d'une image a analyser et un tableur pour l'analyse de l'image ainsi affichee. On peut utiliser un boitier de commande a tenue manuelle pour naviguer sur le tableur et selectionner certaines cases dudit tableur. Le boitier de commande peut egalement servir a selectionner des points de menus ainsi que des caracteres alphanumeriques en tant que parametres a entrer dans le tableur. Les menus comprennent divers outils et fonctions informatiques, telles que des fonctions de vision. Les images sont visibles au travers du tableur, qui est semi-transparent. Le tableur est concu pour des executions de cases conditionnelles. Il peut egalement inclure des fonctions faisant intervenir des valeurs memorisees pendant un certain laps de temps. Lorsque le boitier de commande indique une case particuliere de tableur, un changement se produit dans l'aspect de l'image affichee. Le tableur peut en outre renfermer des cases concues pour amortir des signaux de sortie, ce qui donne une reference circulaire pour fonctionnement recursif, ainsi que des cases auxquelles peut etre attribuee une profondeur arbitraire en dimension temps. Par ailleurs, il est possible d'instancier des objets de vision complexes sous forme d'une case unique dans le tableur, case unique qui comporte des donnees accessibles via une pluralite de fonctions. Enfin, l'interface utilisateur comprend un masque pour tableur qui permet d'obscurcir des parties du tableur et de ne pas en obscurcir d'autres, lesquelles peuvent etre utilisees pour le fonctionnement controle du tableur. L'interface utilisateur convient particulierement bien pour des applications de vision machine et autres applications faisant appel a de grands ensembles de donnees.

Abstract (Basic): US 6504605 B1

NOVELTY - A computer system (28) determines co-ordinates of points in response to relative location and intensity of pixels registered on **image** detector, when the light source is directed toward the object (12) such that intensities are correlated with modulation of light source to resolve proportional loss of light intensity and position of pixels at light source.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

(1) **Method** for determining **object coordinates** ; and

(2) System for determining **object coordinates** .

USE - For determining the **coordinates** of object surface in the field of industrial plants, laboratories, microscopy and in metallurgy.

ADVANTAGE - Determines absolute position of points by varying the intensity of illumination projected onto the object. The speed of processing the **coordinate** mapping is improved. Maps the surface **coordinate** of the object with the need of complex equipment, rotational illumination **grids** and additional cost.

DESCRIPTION OF DRAWING(S) - The figure shows a schematic view of the co-ordinate determining apparatus.

----------------	----	--	--	-------------	--

Abstract (Basic): WO 200277869 A1

NOVELTY - Method consists in specifying a structured web information assembly, acquiring the assembly from a source, selecting a first information object, obtaining its structure location, coding an identifier characteristic of the selected object, re-acquiring the specified assembly from the source, obtaining a second information object located at the structure location within the assembly, generating a second identifier and generating a change indicator if the second identifier differs from the first.

DETAILED DESCRIPTION - The web page **table** level containing the selected information object is determined, a position and level variable to the selected object position and web page level are set, the web page **row** and **column** position are determined for the information object at the position and level of the variable for appending to the information object ID, the object type is determined and if it differs from the body navigation is carried out in the structured information assembly to a position one level up from the current level, and a position and level variable are set to the position and level navigated to. There are INDEPENDENT CLAIMS for:

(1) A **method** of monitoring web page information **objects**
(2) An arrangement for detecting a web page change in a computer network

(3) A client-server arrangement for a networked computer system
USE - Method is for processing structured data (web site information) to detect a change and generate a notification.

DESCRIPTION OF DRAWING(S) - The figure shows a monitoring system structure.

AU 200116499	A		G06F-003/033	Based on patent WO 200140923
--------------	---	--	--------------	------------------------------

Abstract (Basic): WO 200140923 A1

NOVELTY - Touch panel (3a) has translucent layer (6) with fine particle dispersion structure of **transparent matrix** and dispersed phase of fine particles. Translucent layer is **transparent matrix** resin and solid component incompatible with matrix resin and having average particle diameter of 0.1 to 20 μ m. Amount of solid component is about 0.01 to about 5 parts by wt relative to 100 parts by wt of **transparent matrix** resin.

DETAILED DESCRIPTION - Touch panel has translucent layer of **transparent matrix** resin and solid component incompatible with matrix resin and having average particle diameter of 0.1 to 20 μ m. Amount of solid component is about 0.01 to about 5 parts by wt relative to 100 parts by wt of **transparent matrix** resin. Difference in refractive index between solid component and matrix is about 0.1 to about 2. Translucent layer (6) comprises, for example, poly(vinyl acetal) resin and, dispersed therein, white or colored fine particles.

USE - Touch panel for information input device with translucent layer which **image** is projected onto.

ADVANTAGE - Good accuracy of a touched position and also clarity of display.

DESCRIPTION OF DRAWING(S) - Touch panel (3a)

Translucent layer (6)

Abstract (Basic): WO 200101256 A1

NOVELTY - Each node in a context graph (410) of Java code instructions represents a method and includes additional information such as the point of instantiation of the method and/or type of object or objects invoking the method. The object list (210) contains references to one or more objects and the reference **table** (310) contains references to one or more **objects** to be referred to by **one** or more **methods** during a program execution.

DETAILED DESCRIPTION - AN INDEPENDENT CLAIM is included for a method for static analysis of program code.

USE - Static analysis of software code.

ADVANTAGE - More efficient representation of different execution states of software.

DESCRIPTION OF DRAWING(S) - The drawing is a block diagram illustrating a context graph implemented according to one or more embodiments

Abstract (Basic): JP 9091085 A

The appts comprises a **transparent tablet** (3) and display panel (2) through which an **object** is visible. The **object** pattern is traced with a pen (4) on the **tablet** . A calculating part (5) calculates the coordinates data of the traced pattern.

A display panel (2) provided between the **object** and **tablet** displays the coordinate data. A controller (6) compares imposing the coordinates data of traced **object** pattern and **object** pattern by **superimposition** .

ADVANTAGE - Determines exact pattern easily. Displays patterning result immediately.

Abstract (Basic): WO 9202173 A

The computerised method for determining the topography of the cornea of an eye being examined through a system performing a raster-stereography technique comprises first determining the intrinsic and extrinsic parameters of a camera system and a projection system including the position of a projection **grid** relative to the projection system through a calibration procedure. A projection **grid** pattern of the **grid** is projected onto the cornea by the projection system. The surface of the cornea is coated with a topical solution resulting in the eye having a non- **transparent** , light diffusing surface for creating an **overlying grid** pattern on the cornea.

An image of the projected **grid** pattern is obtained to **overlay** the surface of the cornea by a video camera system and determines the location of the **grid** intersection point of the projection **grid** and the location of an imaged projection **grid** intersection point in the image.

USE/ADVANTAGE - Provides more accurate and more easily obtainable means for determining topography of cornea. (128pp Dwg.No.3/36

Abstract (Basic): DE 4121551 A

The display/input device uses a l.c.d. screen (3), overlaid by a transparent plate (2) defining the coordinate of each point on the

display screen. A pen (4) is brought into contact with the transparent plate by the operator to enter data. The needle head of the pen releases a pulsed voltage charge when a switch is closed.

The central section of the transparent plate overlies the screen. Control zones marked around its projecting edge areas are used to enter erase, next page and previous page commands for the display, via the pen.

ADVANTAGE - Increased amt. of data that can be entered and displayed on single screen. (17pp Dwg.No.4/14)

Abstract (Basic): EP 410253 A

The quality control device, used to check the printed sheets, has a video camera (7) scanning the printed sheets with the obtained digital **image** data entered in a memory. The scanning table has measuring devices (12), for quality control data, eg a colour measuring devices, register measuring device or a manual **scanner**. A light source (9) is arranged parallel to the video camera (7) used for representation of data and for providing a guide for the measuring devices.

One or more **image** evaluation systems between the video camera (7) and the light source (9) provide pattern recognition using the stored **image** data.

ADVANTAGE - Complex quality control for adjusting printing colour settings. (9pp Dwg.No.2/3

Abstract (Basic): WO 9005963 A

The **scanner**, having an elongated detector array (24) and two optical mice (20, 22) are placed on the page to be scanned and the orientation of the **scanner** is then determined with respect to a grid

pattern (13), by using motion detection information provided by the two mice.

The **scanner** is then positioned at the starting point from which to start detection and moved across the surface of the page and grid pattern. The grid pattern is preferably transparent to visible light, such that the two mice detect only the grid whilst the detector array senses only the **image**.

ADVANTAGE - Assigns information collected by N detector elements to precisely N, not necessarily different, positions in the memory regardless of the angle formed by the detector array with X-axis. (32pp Dwg.No.1/10

Abstract (Basic): EP 199454 B

The apparatus includes a holding device for a document with a surface to be read, a reader for the **image** information on the surface and a device for entering position information of the **image** on the surface to be read.

The **image** reader includes a source for illuminating the document surface, a photoelectric detector of light reflected from the surface and a guide for supporting the source, detector and connector to be driven in parallel with the document surface. The position entering device includes a transparent position detector plate and a unit which is movable over the plate.

ADVANTAGE - Capable of reading **image** information and entering position information in real time. (33pp Dwg.No.4/11)

ABSTRACT

PROBLEM TO BE SOLVED: To provide an **image** processor which can obtain a line drawing like an illustration only through simple operation without increasing the cost.

SOLUTION: A **digital camera** A has a control part 100 which controls the entirety, a ROM 150 which stores an operation program, etc., of the **digital camera** A, and a RAM 160 which stores **images** photographed by the camera 1 and line drawings inputted to a **transparent table** 2 or **images** to be displayed at a liquid crystal display part 3.

ABSTRACT

PURPOSE: To make it possible to recognize a character by virtual frame size by preparing a virtual frame capable of directly inputting a hand-written character to a required position on a screen and writing an input character with required size in the virtual frame.

CONSTITUTION: A ROM 11 storing an application program or, etc., a display device 2, a RAM 12 for storing inputted data, and keys 1, etc., for inputting data are connected to a CPU 6 to be a control part. The touch panel 1 for inputting hand-written data (**image** data) is connected to the device 2 and the **transparent tablet** (coordinate input device) 1 is connected to the CPU 6 through an A/D converter 5. A ROM 20 storing a recognizing dictionary for recognizing the hand-written data and a RAM 21 to be used as a work area necessary for recognizing processing are connected to the CPU 6.

ABSTRACT

PURPOSE: To perform character recognition in the minimum frame size by providing a virtual frame where hand-writing input can be performed at the desired position of a screen directly even when an input character is written on the virtual frame in desired size.

CONSTITUTION: A ROW 11 in which an application program, etc., is stored, a display device 2, a RAM 12 to store inputted data, and a key 1 for data input, etc., are connected to a CPU 6 that is a control part. Also, a touch panel 1 to input hand-written data(**image** data) is connected to the display device 2, and a **transparent tablet** (coordinate input device) 1 is connected to the CPU 6 via an A/D converter 5. Furthermore, a ROM 20

which stores a dictionary for recognition to recognize the hand-written data and a RAM 21 used as a work area are connected to the CPU 6 that is the control part.

ABSTRACT

PURPOSE: To mask an original with the high degree of freedom and to prevent the position of a mask **image** from being deviated to characters on an original by generating the mask **image** to be displayed on a mask **image** display panel based on coordinates detected by a coordinate detecting means.

CONSTITUTION: By using the keyboard of a document preparing device, input of the first line of a document is started and when the preparation of the document for one line on the original is completed a document preparing person designates the coordinates of an a1 (X1,Y1) on a **transparent tablet** 3 by a pen or a finger, etc. Based on the coordinate data from the **transparent tablet** 3, a mask **image** generation part 9 displays the mask **image** on a mask **image** display panel 2 over the range of X1 in the X axis direction and Y1 in the Y axis direction with coordinates (0, 0) at the upper left end of the mask **image** display panel 2 as an origin. Thus, the original can be masked with the high degree of freedom such as masking in the middle of the line or the like, and there is no problem to deviate the position of the mask **image** to the characters on the original.

ABSTRACT

PURPOSE: To eliminate the need of a special correction and to thin the thickness by utilizing X driving line orthogonal to a Y driving line of a flat display for detecting as coordinate, and constituting integrally the device by adding a tablet function.

CONSTITUTION: A **transparent tablet** is eliminated, and an X driving line 12 and a Y driving line 13 of a liquid crystal display 1 are utilized as they are for the matrix wiring for detecting a coordinate. That is, the device consists of an input display integral type constitution which can plot and display a handwritten input position by a pen touch and an **image** position subjected to echo-back display in the same position by adding a tablet function of a matrix driving type liquid crystal display. Accordingly, a character, a graphic can be plotted, and simultaneously, can be displayed by a handwritten input. In such a way, a correcting circuit for a table input coordinate value is not required, and also, the thickness can be thinned.

ABSTRACT

PURPOSE: To obtain the three-dimensional coordinate data on an **image** sketch in a comparatively faithful and easy way by drawing a feature line of an original drawing along the upper surface of a **see - through grid** of a see-through frame and performing the adverse see-through conversion based on various parameters used for construction of the see-through frame.

CONSTITUTION: A key line is drawn along a prescribed **see - through grid** surface 2 based on an **image** sketch A. Thus a feature drawing B is obtained. Then the coordinate data on the key line is read by a reader 3 and at the same time fetched to a computer 4 via an input/output means 5. An adverse see-through conversion means 6 performs the adverse see-through conversion to acquire the three-dimensional coordinate data with use of various parameters (visual point distance, axial revolving angle, etc.) used for construction of a see-through frame 1. The obtained three-dimensional data is held by a holding means 7. Thus the three-dimensional coordinate data of the **image** sketch can be obtained in a comparatively faithful and easy way.

ABSTRACT

PURPOSE: To perform an editing operation as observing a display picture by forming a tablet in transparency, and arranging a display part to display simulation by superimposing on the lower plane of the tablet.

CONSTITUTION: The device is comprised of a liquid crystal panel 25 arranged on the upper plane of an original cover 23, a **transparent tablet** 26 arranged by superimposing on the upper plane of the liquid crystal panel 25, and a stylus pen 27 to obtain two-dimensional coordinate information on the tablet i.e. the liquid crystal panel 25 by pressing the upper plane of the tablet 26, and a demired **image** editing operation is performed with the tablet 26, the stylus pen 27, and an edit operating panel 28, and an edited result is displayed on the liquid crystal panel 25 at need. The edited result obtained by such editing operation is duplicated on a transfer sheet with a main body 22.

ABSTRACT

PURPOSE: To cope with questions in various types of formats, to drastically decrease marking processing, and to attain efficient learning by designating position coordinates on the screen of a character, a graphic and an **image**, and inputting answering data.

CONSTITUTION: A designated question file is selectively read from a storage device 6 connected to a controller 1, and the character, graphic and **image**

are displayed on the screen of a display device 5. The coordinate data corresponding to the indicated position on the screen are inputted by a stylus pen 3 of a position input means 4. The indicated position data at such a time are fetched from a **transparent tablet** 2, and a prescribed mark M is displayed on the screen. The coordinates on the mark display are collated with correct answer data, the answer is marked, and the time up to an answer input in such a case is controlled. For this reason, a freedom degree can be applied to the format of the question, and the marking can be efficiently executed.

ABSTRACT

PURPOSE: To control a display screen without obstructing the proceeding of explanation, by providing a projection type display device and a screen controller having a panel for displaying the same information and a transparent coordinate input panel.

CONSTITUTION: An original stored in a processor 5 is displayed on a screen 4 through an **image** display controller GDC 2a. A menu of a **transparent tablet** 1a is pressed with a pen 1d and coordinate information is sent to the processor 5 through a control circuit 1b. An instruction of the processor 5 is decoded by the GDC 2a and display information of the next page original is written in a memory 2b. A distributing circuit 2c sends video signals 2f, 2g consisting of a synchronizing signal group 2d and a digital three-primary color signal 2e, to an **image** controller 1 and a projector 3. When an instruction for executing linear picture drawing between pressure points with the pen 1d is sent to the GDC 2a, handwritten character and graphic can be superposed on the present display **image** and displayed on the screen 4, while looking at a display panel 1c, and understanding the contents can be urged without suspending an explanation.

ABSTRACT

PURPOSE: To remarkably improve the efficiency of input jot by integrating vector data and attribute data of an element graphic form via a label.

CONSTITUTION: A map 1 functioning as a read object is read by a drawing read section 2 and its line image data is stored in the internal image memory. An element graphic cutting-out section 3 cuts out an element graphic form (house) comprising a prescribed loop graphic form from the line image data read by the graphic read section 2 and vector data comprising a coordinate string representing the geometrical structure at each cutting-out element graphic form and labeling is applied in correspondence to the vector data. Then the element graphic cutting-out section 3 stores in the internal vector data table in correspondence to the vector data and label. The labeled vector data is given to an output section 4, a display section 5 and a map data generating section 6.

ABSTRACT

PURPOSE: To print a printing image edited according to a format indicated, by providing a printer controller for editing the printing image of one page by developing the image and text data inputted from the outside on the basis of the format indicated.

CONSTITUTION: A printer controller 21 has a processor 21a, ROM21b storing a large number of formats showing the arrangement ways of a control program, an image and a text prior to printing, RAM21c storing a processing result, a host communication block 21d performing the transfer of data between a host apparatus 1 and said block 21d and input/output ports 21e, 21f. A format indication means 22 displays the arranged format image and menu image sent from the controller 21 on a liquid crystal display 22a, and digitally indicates the predetermined position on a transparent tablet 22b to perform the correction or registration of the formats and printing is performed by a printer 23.

ABSTRACT

PURPOSE: To effectively perform the digital input of drawing information on a sheet of allocation designating paper, by outputting an allocation **image** which instructs and displays the drawing information on the sheet of allocation designating paper placed on a transparent film on which plotting line information that becomes the reference of a position on a **transparent tablet**, is drawn.

CONSTITUTION: The **transparent tablet** 1 is constituted of a light source 1a, and a transparent glass 1b, etc., and inputs a point coordinate picked by a stylus pen 1c which becomes an instruction member, to a system controller 13. On the **transparent tablet** 1, the transparent film 2 consisting of, for example, an OHP film, is placed, and the plotting line is printed in black on the transparent film 2 in advance. Also, the drawing information such as a ruled mark, etc., is drawn on the sheet of allocation designating paper. And by instructing an arbitrary position coordinate on the sheet of allocation designating paper 3 placed while setting the transparent film 2 placed on the **transparent tablet** 1 as reference by the instruction member, a drawing means draws an allocation **image** on a display unit 14. In such way, a drawing output means draws the allocation **image** displayed on the display unit 14 on a sheet of translucent paper.

ABSTRACT

PURPOSE: To use both surfaces of a **transparent tablet** by enabling the

transparent tablet to be used while put over a display and separated (turned over).

CONSTITUTION: A drawing input device equipped with the **transparent tablet 8** which detects an **image** drawn with a handwriting pen 4 and outputs a coordinate signal and the display 2 which displays a drawn **image** corresponding to the input drawing information is so constituted that the **transparent tablet 8** can be put over said display 2 and separated from the display 2 by being turned over to in front of the main body by an opening and closing member 9 such as a hinge. Then an Y coordinate conversion part 15 which converts coordinates on the **transparent table 8** and a tablet state detection part 13 which detects the state of the **transparent tablet 8** are provided so that the track of the handwriting pen 4 which is drawn on the **transparent table 8** and the drawn **image** displayed on the display 12 are not mutually reversed while the **transparent table 8** is separated.

ABSTRACT

PURPOSE: To widen remarkably drawing function by handwritten **image** by providing a mechanism than detects pressure of a nib and a controlling means that changes the width of display lines of the locus of the nib according to detected pressure.

CONSTITUTION: A tablet 4 is transparent made of transparent plate of glass, acrylic, and when the nib of a pen 1 for tablet is on the tablet 4, detects the position and sends out the positional information to a controlling device 2. A display device 3 is positioned under the **transparent tablet 4**, and displays an **image** by control of the controlling device 2. Locus positional information of the nib on the tablet 4 and pressure of the nib are detected, and line width of the locus of the nib is changed according to pressure of the nib and displayed on the display device 3. Thus, delicate change of drawing (thickness) by hand writing can be expressed and line drawing similar to handwriting by a writing brush becomes possible.

ABSTRACT

PURPOSE: To obtain a large tablet of integrated input/output type, by providing a projector screen on the opposite side and on the input plane of a light **transparent tablet** to display an **image** on a screen by a projector, and coinciding a video from the projector with a position data obtained from the tablet.

CONSTITUTION: The titled system is constituted in such a way that a host computer 6 displays a specific point on the projector, and transmits it to a tablet control microcomputer 7, and a positioning can be performed by pressing the display point with a pen, and the number, and the positions of the specific point are decided by the characteristics of the tablet and the projector. In such a case, only multiplication for the adjustment of a size, and addition for the fitting of an origin, performed by an arithmetic calculation by the microcomputer 7 are enough by aligning both the position coordinate of the video, and that of the tablet in a horizontal and a vertical directions as x-y coordinates. Thus, the positioning of the video of the projector, and the tablet can be easily performed

ABSTRACT

PURPOSE: To enable a hand-written character input display system to display characters in large quantities by combining on one-body hand written input display device with a high resolution display device.

CONSTITUTION: An LCD controller 11 displays on an LCD 72 some part of information displayed on a CRT monitor 12. A **transparent tablet** is placed on the LCD 72, and a hand written character or a graphic can be inputted through a stylus 6. An **image** initially written is displayed on the LCD 72 and then a character recognized next is displayed. A window showing which part of the CRT monitor 12 is displayed on the LCD 72 is displayed, and an icon (fixed pen touch key) is displayed on a display device 7. When the icon is touched by the stylus 6, the window can be moved.

ABSTRACT

PURPOSE: To make an operation convenient by displaying the document information held by a code format and the handwritten information held by a bit map format, on a display which is formed so one body with a handwritten information input means, transmitting and receiving both the information by its format, and shorting it as prescribed.

CONSTITUTION: Document information of a code format which is transferred through a circuit 9 is stored in a document buffer 6 by a code format through a communication control part 8, in a composite communication terminal equipment 1, and its document information is read out by a display control part 7 and displayed on a display 2. On the other hand, a handwritten information input means is constituted of a **transparent tablet** 3, an input pen 3a and a coordinate position detecting part 4, the tablet 3 is attached so as to contact to a display picture of the display 2, and information which is handwritten and entered in the tablet 3 with the pen 3a is detected by the detecting part 4 and stored in an **image** buffer 5 by a bit map format. In this state, the control part 8 sends out each information of the buffers 6, 5 by each code and bit map format, respectively, and transfers it to an electronic mail system, etc. from the circuit 9.

ABSTRACT

PURPOSE: To improve the operability and to improve the read precision by reading the position of an additional **image** through an **image** reading means brought into contact with an original and writing the additional **image** in a storage means stored with a read **image** of the original corresponding to the original.

CONSTITUTION: The **image** signal of the original read by an **image** sensor 5 is supplied to a signal processing circuit 9 and stored in a memory 9e. Then, the **transparent tablet** 8 of a cover part 7 is placed on the original 29. A user writes the additional **image** on the tablet 8 over a look at the original through the tablet, and sends the position signal of the additional **image** to a circuit 9 in sequence. The circuit 9 converts the position signal into an address of the memory stored with the read signal of the the same position of the original 2 with the tablet 8 and rewrites the read **image** signal stored in the address with the additional **image** signal. Consequently, both **image** signals are superposed one over another and stored, and then displayed on CRTs 10a and 10b.

ABSTRACT

PURPOSE: To remarkably improve the efficiency of input jot by integrating vector data and attribute data of an element graphic form via a label.

CONSTITUTION: A map 1 functioning as a read object is read by a drawing read section 2 and its line image data is stored in the internal image memory. An element graphic cutting-out section 3 cuts out an element graphic form (house) comprising a prescribed loop graphic form from the line image data read by the graphic read section 2 and vector data comprising a coordinate string representing the geometrical structure at each cutting-out element graphic form and labeling is applied in correspondence to the vector data. Then the element graphic cutting-out section 3 stores in the internal vector data table in correspondence to the vector data and label. The labeled vector data is given to an output section 4, a display section 5 and a map data generating section 6.

Abstract (Basic): US 6504605 B1

NOVELTY - A computer system (28) determines co-ordinates of points in response to relative location and intensity of pixels registered on image detector, when the light source is directed toward the object (12) such that intensities are correlated with modulation of light source to resolve proportional loss of light intensity and position of

pixels at light source.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) Method for determining object coordinates ; and
- (2) System for determining object coordinates .

USE - For determining the coordinates of object surface in the field of industrial plants, laboratories, microscopy and in metallurgy.

ADVANTAGE - Determines absolute position of points by varying the intensity of illumination projected onto the object. The speed of processing the coordinate mapping is improved. Maps the surface coordinate of the object with the need of complex equipment, rotational illumination grids and additional cost.

DESCRIPTION OF DRAWING(S) - The figure shows a schematic view of the co-ordinate determining apparatus.

US 20020143813 A1 G06F-015/00

Abstract (Basic): WO 200277869 A1

NOVELTY - Method consists in specifying a structured web information assembly, acquiring the assembly from a source, selecting a first information object, obtaining its structure location, coding an identifier characteristic of the selected object, re-acquiring the specified assembly from the source, obtaining a second information object located at the structure location within the assembly, generating a second identifier and generating a change indicator if the

second identifier differs from the first.

DETAILED DESCRIPTION - The web page **table** level containing the selected information object is determined, a position and level variable to the selected object position and web page level are set, the web page **row** and **column** position are determined for the information object at the position and level of the variable for appending to the information object ID, the object type is determined and if it differs from the body navigation is carried out in the structured information assembly to a position one level up from the current level, and a position and level variable are set to the position and level navigated to. There are INDEPENDENT CLAIMS for:

- (1) A **method** of monitoring web page information **objects**
 - (2) An arrangement for detecting a web page change in a computer network
 - (3) A client-server arrangement for a networked computer system
- USE - Method is for processing structured data (web site information) to detect a change and generate a notification.

DESCRIPTION OF DRAWING(S) - The figure shows a monitoring system structure.

Treatment: Theoretical (T)

Abstract: Absolute core-power measurements were made in the nuclear reactor core of the Pool Critical Assembly (PCA) at ORNL. Absolute core-power traverse measurements were made with a miniature, high-pressure, ionization fission chamber containing a light-weight deposit of U-235. The clean PCA core makes accurate and reproducible determination of the source strength for the PCA pressure vessel benchmark possible. This is important since the benchmark is intended as reference field for pressure vessel surveillance in light water reactors. To supplement the measurements, calculations of the core power distribution were made elsewhere. There is good agreement between experimental and calculated values. The combined data were used to obtain the total core power. There is **excellent** agreement between these values and core power indication in reactor instrumentation. An extensive inventory of uncertainties in the core power determination is provided. (2 Refs)

Abstract (Basic): WO 200101256 A1

NOVELTY - Each node in a context graph (410) of Java code instructions represents a method and includes additional information such as the point of instantiation of the method and/or type of object or objects invoking the method. The object list (210) contains references to one or more objects and the reference **table** (310) contains references to one or more **objects** to be referred to by **one** or more **methods** during a program execution.

DETAILED DESCRIPTION - AN INDEPENDENT CLAIM is included for a method for static analysis of program code.

USE - Static analysis of software code.

ADVANTAGE - More efficient representation of different execution states of software.

DESCRIPTION OF DRAWING(S) - The drawing is a block diagram illustrating a context graph implemented according to one or more embodiments

Language: English
Document Type: JA; (Journal Article) **Treatment:** T; (Theoretical); X; (Experimental)

Journal Announcement: 9908W3

Abstract: In this study, a novel approach to a measuring methodology and calibration method for an optical non-contact scanning probe system is proposed and verified by experiments. The optical probe consists of a line laser diode and two charge-coupled device (**CCD**) cameras and is placed on a computer numerical control (CNC) machine to measure the workpiece profiles. A space mapping method using the least-squares algorithm is presented for the probe calibration and profile measurement. This method provides a simple and accurate calculation of the relationship between the real space plane and its related **image** space plane in a **CCD** camera. A **transparent grid** with regularly spaced nodal points is used to construct the space mapping function. The space coordinate of an **object** can be obtained from its **image** in the **CCD** camera via the mapping function. The measured profile data are smoothed by the B-spline blending function and can be transferred to a CAD/CAM package for industrial applications. Experimental results show that this technique can determine the 3-D profile of an **object** with an accuracy of 60 μ m. (Author abstract) 16 Refs.

Title: METHOD FOR PROVIDING DIFFERENT DISPLAY MODES FOR AN OBJECT/OBJECT SET.

Author: Anon

Source: IBM Technical Disclosure Bulletin v 28 n 2 Jul 1985 p 866

Publication Year: 1985

CODEN: IBMTAA ISSN: 0018-8689

Language: ENGLISH

Document Type: JA; (Journal Article) Treatment: A; (Applications)

Journal Announcement: 8509

Abstract: Some real-time multiple data processing systems provide for varying types of **objects** and **object** sets. Each of these **objects** and **object** sets have specific editing rules that affect how they are viewed within a display space, which is the space on the physical screen allocated for viewing and editing the data contained in the **object** or **object** set. One type of **object** set is a superblock, which is a complex **object** set consisting of text, table or graphic data positioned in such a way that graphic or table data may opaquely overlay other graphic or table data, and text may flow around graphic or table data. In editing a compound document, the operator may want to have a graphic **object** such as a box **transparently overlay** some portion of a text or **table object** set. This situation arises when the operator is proofreading a document. A mechanism within the editor to implement transparent overlaying of **objects** is provided by the new method.

Publication Date: 1982 Country of Publication: USA 581 pp.

Conference Date: 4-7 April 1982 Conference Location: Destin, FL, USA

Language: English Document Type: Conference Paper (PA)

Treatment: Applications (A); Practical (P); Theoretical (T)

Abstract: In many computer **vision** and robotics applications, a high speed algorithm for determining **object** location is an essential part of the performance of the system. The class of algorithms based on projecting a pattern on the **object** to determine three-dimensional surface measurements is considered. This particular method consists of first projecting a grid pattern on the surface of the **object**. An **image** of the **object** with the grid pattern is taken from an arbitrary location to obtain an **image** of the **object** which shows the **grid superimposed** on the **object**. Using six or more selected vertex points, and the distance from the camera to the **object**, the perspective transformation matrix of both the **image** and the grid pattern can be computed. The final three-dimensional **object** coordinates at each vertex point can be computed from the computed **image** vertices and their corresponding perspective transformation matrices. This technique has direct application to visually guided robotic systems as well as miscible guidance and medical treatment. (6 Refs)

REVISION DATE: 20010730

PLAY/Electric **Image** 's Amorphium, a new type of visual tool that allows the user to manipulate 3D **objects** on the screen as if they were balls of clay, simulates pushing, pulling, slicing, and dicing motions easily until the **object** begins to appear as it should. No calculations are required of the user, who is...

...Amorphium's power and automation. A full 3D program with modeling, animation, and rendering, Amorphium **excels** especially for its modeling. The interface has many similarities to that of MetaCreations' Bryce, with simple graphic **overlays** that allow skillful maneuvering of the camera view by dragging the mouse cursor over them. The program moves into different modes when the user chooses from a **row** of options strung across the top of the screen. Choosing a mode pops up other...

...Amorphium is also a 3D paint system that allows the user to paint on 3D **objects** imported in various file formats or created in real time. Amorphium lacks some of the...

...higher end programs but remains a very useful tool for professionals, with good performance and **instant** feedback.
